
Git for Version Control

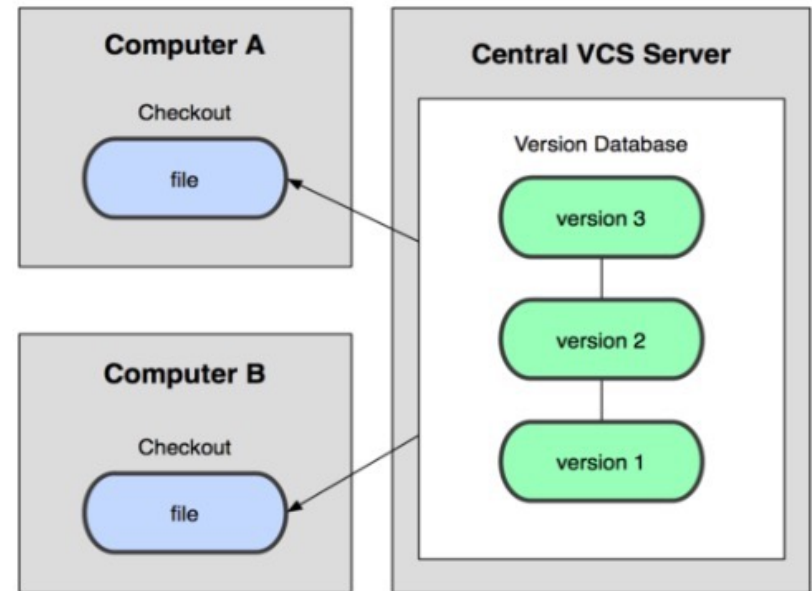

Dr. Katrin Schöning-Stierand

Version Control System - VCS

- ❖ Record changes to a file or set of files over time
- ❖ Access or revert to specific versions
- ❖ Simplifies collaborations

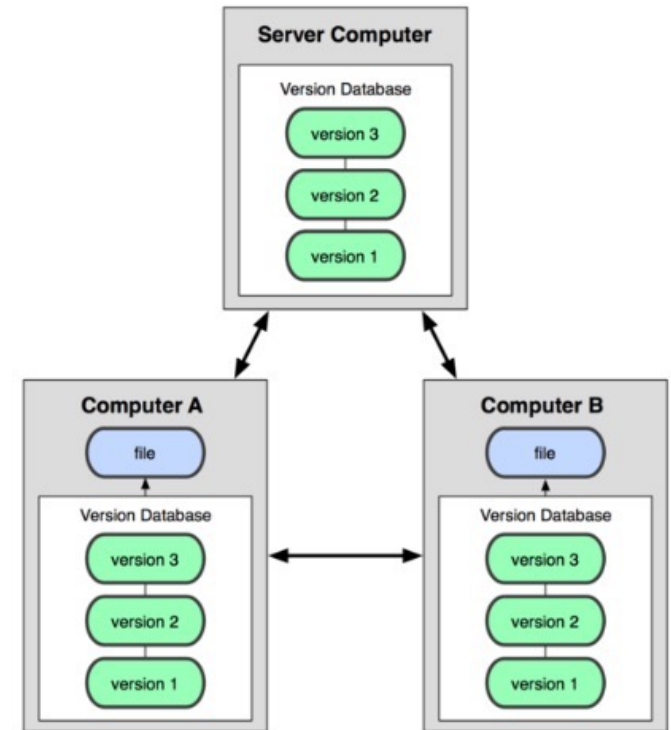

Centralized VCS

- ❖ In Subversion, CVS, Perforce, etc. A central server repository (repo) holds the "official copy" of the code
 - the server maintains the sole version history of the repo
- ❖ You make "checkouts" of it to your local copy
 - you make local modifications
 - your changes are not versioned
- ❖ When you're done, you "check in" back to the server
 - your check-in increments the repo's version

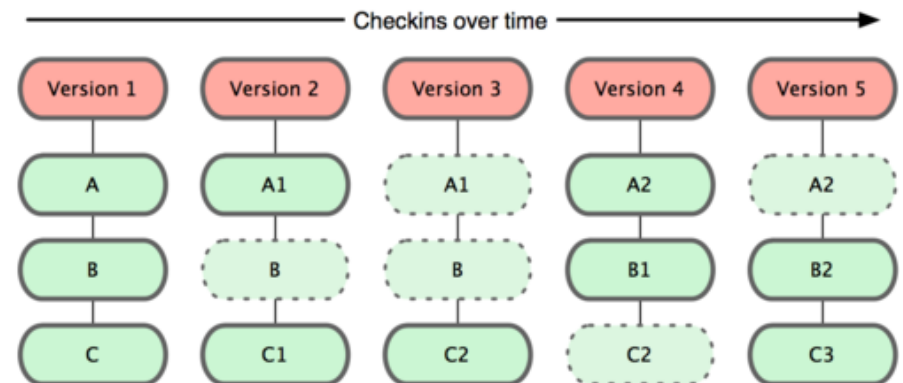

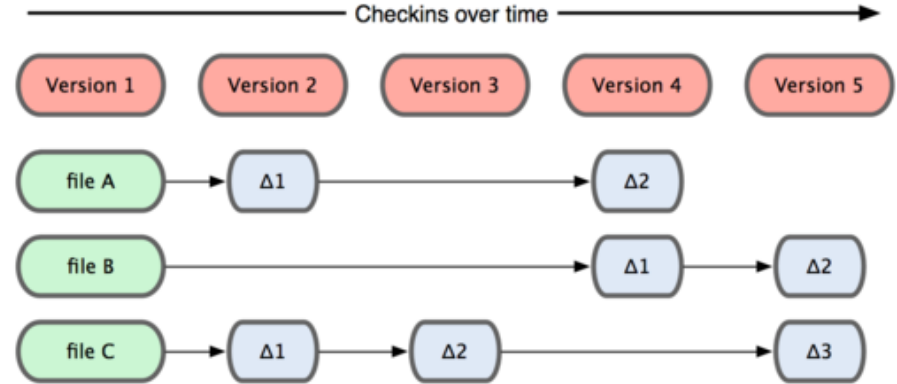

Centralized VCS

- ❖ In git, mercurial, etc., you don't "check out" from a central repo
 - ❖ you "clone" it and "pull" changes from it
- ❖ Your local repo is a complete copy of everything on the remote server
 - ❖ yours is "just as good" as theirs
- ❖ Many operations are local:
 - ❖ check - in/-out from local repo
 - ❖ commit changes to local repo
 - ❖ local repo keeps version history
- ❖ When you're ready, you can "push" changes back to the server

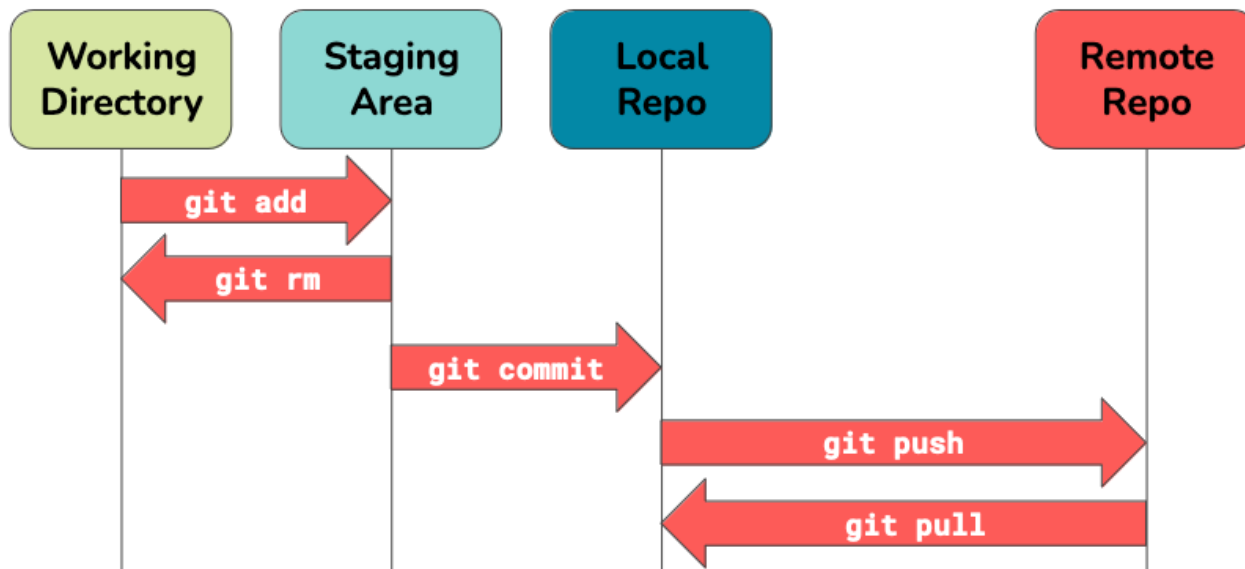

Git snapshots

- ❖ Centralized VCS like Subversion track version data on each individual file.
- ❖ Git keeps "snapshots" of the entire state of the project.
 - ❖ Each check-in version of the overall code has a copy of each file in it.
 - ❖ Some files change on a given check-in, and some do not.
 - ❖ More redundancy, but faster.

Standard Workflow in GIT

- ❖ **Modify** files in your working directory.
- ❖ **Stage** files, adding snapshots of them to your staging area.
- ❖ **Commit**, which takes the files in the staging area and stores that snapshot permanently in your Git directory.
- ❖ **Push**, which takes local changes to the remote repository
- ❖ **Pull**, which takes remote changes to the local repository

Installing/learning Git

- ❖ Git website: <http://git-scm.com/>
 - Free online book: <http://git-scm.com/book>
 - Reference page for Git: <http://gitref.org/index.html>
 - Git tutorial: <http://schacon.github.com/git/gittutorial.html>
 - Git for Computer Scientists
 - <http://eagain.net/articles/git-for-computer-scientists/>
- ❖ At command line: (where verb = config, add, commit, etc.)
 - git help verb

Git commands

command	description
<code>git clone <i>url</i> [<i>dir</i>]</code>	copy a Git repository so you can add to it
<code>git add <i>file</i></code>	adds file contents to the staging area
<code>git commit</code>	records a snapshot of the staging area
<code>git status</code>	view the status of your files in the working directory and staging area
<code>git diff</code>	shows diff of what is staged and what is modified but unstaged
<code>git help [<i>command</i>]</code>	get help info about a particular command
<code>git pull</code>	fetch from a remote repo and try to merge into the current branch
<code>git push</code>	push your new branches and data to a remote repository
others: <code>init</code> , <code>reset</code> , <code>branch</code> , <code>checkout</code> , <code>merge</code> , <code>log</code> , <code>tag</code>
